

DESCRIPTION

ENTERPRISE EVALUATION DEVICE AND ENTERPRISE EVALUATION PROGRAM

5

TECHNICAL FIELD

[0001]

The present invention relates to an enterprise evaluation device and enterprise evaluation program capable of evaluating the value of an enterprise based on patent documents.

10

BACKGROUND ART

[0002]

Conventionally, Japanese Patent Laid-Open Publication No. 2000-348015 (pages 3 to 7, FIGs. 1 to 4) describes a system, method and recording medium for evaluating an evaluation item based on first data having a predetermined renewal interval and second data having a renewal interval that is shorter than the first data. This evaluation system has (a) means for creating a first evaluation model according to input of the first data of sample targets, (b) means for applying the first data of the sample targets to the first evaluation model and calculating first evaluation output, (c) means for creating a second evaluation model according to input of the second data and the first evaluation output of the sample targets, (d) means for applying the first data to the first evaluation model according to the input of the first data of an

evaluation target and calculating second evaluation output,
and (e) means for applying the second data and the second
evaluation output of the evaluation target to the second
evaluation model and calculating the evaluation output of the
5 evaluation target, and thereby evaluates the evaluation item
of the evaluation target that could change with time.

[0003]

With the foregoing Japanese Patent Laid-Open Publication
No. 2000-348015, to predict changes in the enterprise
10 evaluation derived from data in which the renewal period is
relatively long such as every year or every quarter, data in
which the renewal period is relatively short such as stock
price, interest and currency exchange that fluctuate from day
to day is used to reflect changes in the economy. In this
15 system, enterprise evaluation is made in a timely manner at
the point in time such evaluation is to be made.

[0004]

Further, Japanese Patent Laid-Open Publication No. 2001-
76042 (pages 4 to 13, FIGs. 4 to 6) describes an intellectual
20 property evaluation device and intellectual property
evaluation method for evaluating the proprietary nature of
intellectual property relating to a pending or registered
invention or the like. This evaluation device has an actual
profit input means for inputting data regarding the actual
25 profit, a compound cost rate input means for inputting data
regarding the compound cost rate per year, a compound present

value calculation means for calculating the compound present values of annual compensation by multiplying the data regarding the actual profit with the data regarding the compound cost rates per year, an intellectual property price calculation means for calculating an intellectual property price by totaling the compound present value of the calculated annual compensation amounts, and an output means for outputting the calculated intellectual property value amount calculated with the intellectual property price calculation means.

[0005]

The invention described in Japanese Patent Laid-Open Publication No. 2001-76042 is for comprehending the asset value of currently existing patents by depreciating registered patents and the related sales volume and profits. Moreover, with respect to the evaluation of the value of each patent, the input ranking of evaluation conducted by one's own company and evaluation conducted by other companies is evaluated as the contribution.

[0006]

Further, Japanese Patent Publication No. 2002-502529 of Translation of PCT Application describes a method for processing data, including the steps of maintaining at least one first patent database, maintaining at least one second non-patent database of interest to a corporate entity, and maintaining one or more groups, wherein each of the one or

more groups have an arbitrary number of patents from at least one first database, and further including a step of automatically processing non-patent information from at least one second database and one patent of the foregoing one or
5 more groups.

[0007]

For financial institutions, investors and corporations, it is extremely important to assess the enterprise value of investment destinations and customers. Thus, conventionally,
10 in order to assess such enterprise value, attempts have been made for objectively judging the enterprise value based on management-finance information regarding management, finance or stock prices. Among such attempts, there are methods of screening and ranking the company to be evaluated via
15 multivariate analysis, statistical techniques and data mining methods.

DISCLOSURE OF THE INVENTION

[0008]

20 Recently, with the increasing ratio of intangible assets making up the enterprise value, the value of intangible assets now has a great influence on the enterprise value. Nevertheless, generally speaking, an enterprise value is not a book value in a balance sheet represented by total assets =
25 liabilities + stockholders' equity, and is roughly calculated by the total market value + liabilities. Therefore, when

complete current value accounting is applied, the amount calculated by the total market value - stockholders' equity will represent the validity of invisible assets (intangible assets) of the enterprise. Nevertheless, there is a drawback
5 in that it is difficult to specifically calculate the value of intangible assets and judge the value according to application.

[0009]

Further, with the system described in Japanese Patent Laid-Open Publication No. 2000-348015, a model for enterprise
10 evaluation is created by inputting data (dynamic data) with a short renewal period such as stock prices in addition to data (static data) with a long renewal period such as financial data to be publicly announced at the end of the fiscal term. The static data and dynamic data related to the evaluation
15 target are applied to this model. Thereby, the item to be evaluated, which could change over time, is calculated in a timely manner and as the latest information. Nevertheless, there is a drawback in that it is not possible to judge the attitude of enterprises to patents and the trend of
20 intellectual property strategy.

[0010]

Moreover, the intellectual property evaluation device described in Japanese Patent Laid-Open Publication No. 2001-76042 is to evaluate the intellectual property such as patents
25 one by one each year, and there is a drawback in that it is not possible to judge the value of a specified enterprise.

Further, in this present day when the number of joint inventions and joint applications is increasing, there is a drawback in that it is not possible to accurately judge the number of registered inventions of an enterprise and improve
5 the reliability of data upon acquiring the number of registered inventions per unit of applicant.

[0011]

Further, with the intellectual property evaluation device described in Japanese Patent Laid-Open Publication No. 2001-
10 76042, it is not possible to associate and display the sales volume and the term of patent right. Thus, there is a drawback in that the difference in technical strength and monopoly power per industry or per enterprise cannot be read clearly, and the research and development strategy or intellectual
15 property strategy of enterprises cannot be analyzed accurately.

[0012]

With the method for processing data described in Japanese Patent Publication No. 2002-502529 of Translation of PCT Application, there is a database containing patent information
20 data and non-patent information data (finance information, R&D information, configuration table of manufactured products, R&D expenses of manufactured products, royalty income from patents of manufactured products, information of competitors and so on of the enterprise), a network is connected with the user, the
25 user inputs information that he/she wants and such information is subject to computer processing and provided to the user,

whereby the user is able to make an evaluation. Further, in addition to searching patents relating to products manufactured by the enterprise, R&D expenses relating to such patents and the royalty income thereof are calculated and processed. Nevertheless, there is no materiality in the subject matter of the calculation processing other than $(R\&D)/(\text{number of patents})$, and there is a problem in that it is also difficult to implement regarding the other indexes. Moreover, there is a drawback in that it is not possible to evaluate enterprises by tabulating all patents owned by an enterprise, not specific patents, and then combining this information and finance information.

[0013]

The total market value is determined by the stock prices in the market. Thus, whether the current stock price and the value of intangible assets calculated based on the stockholders' equity in the book are valid is an extremely important element for investors in the decision-making of stock trading. Enterprises are hoping to increase their value of intangible assets and thereby increase their enterprise value by procuring funds and continuing technical developments. Therefore, increasing the value of intangible assets will be positioned as an important issue in the management strategy for enterprises.

[0014]

There have been attempts of trying to evaluate intangible

assets from the past. Nevertheless, there is a drawback in that it is not possible to evaluate the enterprise value validity by quantitatively and qualitatively incorporating the value of intangible assets. Further, when making an investment
5 in a specified enterprise or jointly developing a product with a specified enterprise, or desiring to be employed in a specified enterprise, there is a drawback in that it is difficult to know the trend of such enterprise in each technical field or to predict the potential of such enterprise.

10 [0015]

Thus, in light of the foregoing conventional circumstances, an object of the present invention is to provide an enterprise evaluation device and enterprise evaluation program capable of acquiring registered patent
15 publications of a specified enterprise, analyzing the research and development strategy and intellectual property strategy of enterprises, and, together with management-finance information, performing enterprise value evaluation.

[0016]

20 In order to achieve the foregoing object, the present invention comprises:

gazette acquisition means for acquiring registration gazettes based on patent applications filed by a specified enterprise within a specified period;

25 number-of-inventions acquisition means for acquiring the number of patents subjected to, before a predetermined time,

registration or number of claims of the patents as the number of inventions from the acquired registration gazettes;

number-of-extinguished-inventions acquisition means for acquiring the number of extinguished inventions that

5 extinguished before a predetermined time from the acquired number of inventions;

total number-of-effective-patents calculation means for calculating the total number of effective patents by subtracting the number of extinguished inventions from the

10 acquired number of inventions;

total effective patent remaining ratio calculation means for calculating the total effective patent remaining ratio through dividing the calculated total number of effective patents by the number of inventions; and

15 output means for outputting the calculated total effective patent remaining ratio to display means, printing means, recording medium, or another telecommunications device via a communication line.

[0017]

20 Further, in order to achieve the foregoing object, the present invention comprises:

gazette acquisition means for acquiring registration gazettes based on patent applications filed by a specified enterprise within a specified period from a database;

25 number of inventions per applicant acquisition means for acquiring the number of patents subjected to, before a

predetermined time, registration or number of claims of the patents as the number of registered inventions from each of said acquired registration gazettes, acquiring the number of applicants described in each of said acquired gazettes, and
5 acquiring the number of registered inventions per unit of applicant through dividing said acquired number of registered inventions by the number of applicants;

number of registered inventions acquisition means for counting said acquired number of registered inventions per
10 unit of applicant for said all acquired gazettes and acquiring the total number of registered inventions as the number of inventions;

number-of-extinguished-inventions acquisition means for acquiring the number of extinguished inventions of patents
15 extinguished before the predetermined time among said acquired number of inventions;

total number-of-effective-patents calculation means for calculating the total number of effective patents by subtracting the number of extinguished inventions from said
20 acquired number of inventions;

total effective patent remaining ratio calculation means for calculating the total effective patent remaining ratio through dividing said calculated total number of effective patents by said number of inventions; and

25 output means for outputting said calculated total effective patent remaining ratio to display means, printing

means, recording medium, or another telecommunications device via a communication line.

[0018]

Further, in order to achieve the foregoing object, the
5 gazette acquisition means of the present invention acquire registration gazettes based on patent applications in a predetermined technical field filed within a specified period by a specified enterprise from a database.

[0019]

10 Further, in order to achieve the foregoing object, the present invention comprises:

gazette acquisition means for acquiring registration gazettes for patents surviving up to a predetermined time among the patent applications filed by a specified enterprise
15 within a specified period from a database;

remaining period calculation means for calculating a term expiration date of each of rights of said acquired registration gazettes, and calculating the remaining period by subtracting the predetermined time from said term expiration
20 date;

patent stock index calculation means for calculating a patent stock index by counting said calculated remaining period for all registration gazettes for patents surviving up to the predetermined time; and

25 output means for outputting said calculated patent stock index to display means, printing means, recording medium, or

another telecommunications device via a communication line.

[0020]

Further, in order to achieve the foregoing object, the remaining period per applicant calculation means of the present invention calculate a term expiration date of each of rights of said acquired registration gazettes, and calculate a remaining period by subtracting the predetermined time from said term expiration date, and acquire the number of applicants described in each of said acquired gazettes, and calculate the remaining period per unit of applicant through dividing said remaining period by the number of applicants.

[0021]

Further, in order to achieve the foregoing object, the patent stock index calculation means of the present invention calculate a patent stock index by counting said calculated remaining period for all registration gazettes for patents surviving up to the predetermined time, and dividing the same by the average number of days of one year or one month.

[0022]

Further, in order to achieve the foregoing object, the present invention comprises:

gazette acquisition means for acquiring registration gazettes for patents surviving up to a predetermined time among the patent applications filed by a specified enterprise within a specified period from a database;

remaining period calculation means for calculating a term

expiration date of each of rights of said acquired
registration gazettes, and calculating the remaining period by
subtracting the predetermined time from said term expiration
date;

5 patent stock index calculation means for calculating a
patent stock index by counting said calculated remaining
period for all registration gazettes for patents surviving up
to the predetermined time;

 average remaining period of total effective patents
10 calculation means for calculating the average remaining period
of total effective patents through dividing said patent stock
index by the number of registration gazettes for patents
surviving up to said predetermined time; and

 output means for outputting said calculated average
15 remaining period of total effective patents to display means,
printing means, recording medium, or another
telecommunications device via a communication line.

[0023]

 Further, in order to achieve the foregoing object, the
20 average remaining period of total effective patents
calculation means of the present invention calculate the
average remaining period of total effective patents through
dividing said patent stock index by the number of registration
gazettes for patents surviving up to said predetermined time
25 and the average number of days of one year or one month.

[0024]

Further, in order to achieve the foregoing object, the present invention uses, as the registration gazettes for calculating the total effective patent remaining ratio, patent stock index or average remaining period of total effective patents, gazettes including publications of patent registrations, publications of examined patent applications, publications of examined utility model applications or publications of utility model registrations.

[0025]

Further, in order to achieve the foregoing object, the present invention comprises:

gazette acquisition means for acquiring registration gazettes based on patent applications filed by a specified enterprise within a specified period from a database;

number-of-inventions acquisition means for acquiring the number of patents subjected to, before a predetermined time, registration or number of claims of the patents as the number of inventions from said acquired registration gazettes;

display data generation means for generating display data for associating said number of inventions and the patent stock index for display; and

output means for outputting said display data to display means, printing means, recording medium, or another telecommunications device via a communication line.

[0026]

Further, in order to achieve the foregoing object, the

present invention comprises:

sales volume acquisition means for acquiring a sales volume of a specified enterprise during a predetermined time from a management-finance database recording management-

5 finance information of an enterprise;

display data generation means for generating display data for associating said sales volume and the patent stock index for display; and

output means for outputting said display data to display
10 means, printing means, recording medium, or another telecommunications device via a communication line.

BRIEF DESCRIPTION OF THE DRAWINGS

[0027]

15 FIG. 1 is a diagram showing the overall configuration of an enterprise evaluation system;

FIG. 2 is a signal processing system block diagram of an enterprise evaluation device;

FIG. 3 is a diagram showing an example of management-
20 finance information;

FIGS. 4A and 4B are diagrams showing an example of technical information (patent information);

FIG. 5 is a chart illustrating the respective indexes of "business, profit, market value" calculated by the enterprise
25 evaluation device and the calculating formula thereof;

FIG. 6 is a chart illustrating the respective indexes of

"business, profit, market value" calculated by the enterprise evaluation device and the calculating formula thereof;

FIG. 7 is a chart illustrating the respective indexes of "R&D, patent" calculated by the enterprise evaluation device
5 and the calculating formula thereof;

FIG. 8 is a chart illustrating the respective indexes of "R&D, patent" calculated by the enterprise evaluation device and the calculating formula thereof;

FIG. 9 is a chart illustrating the respective indexes of
10 "patent portfolio" calculated by the enterprise evaluation device and the calculating formula thereof;

FIG. 10 is a chart showing a display example of a patent stock related index in the electrical equipment industry;

FIG. 11 is a chart showing a display example of a patent
15 stock related index in the chemical industry;

FIG. 12 is a diagram showing the relationship of the patent stock index and total number of effective patents in the chemical industry;

FIG. 13 is a diagram showing the relationship of the
20 patent stock index and total number of effective patents in the electrical equipment industry;

FIG. 14 is a diagram showing the relationship of the patent stock index and sales volume in the chemical industry and electrical equipment industry;

25 FIG. 15 is a processing flowchart upon calculating and outputting the various indexes;

FIG. 16 is a diagram showing a display example of the display menu for selecting the type of index upon evaluating the enterprise value;

FIG. 17 is a diagram showing a state where the user
5 selected "(PT) patent acquisition (registration) related index" in the display menu for selecting the type of index;

FIG. 18 is a diagram showing an example of a case where the user selected "(PS) patent stock related index" in the display menu for selecting the type of index;

10 FIG. 19 is a diagram showing an example of a case where the user selected "patent stock index" from the selection menu of "(PS) patent stock related " in the display menu for selecting the type of index;

FIG. 20 is a diagram showing an example of a case where
15 the user selected "(C) profit related index" among the selection menu of "business, profit, market value" in the display menu for selecting the type of index;

FIG. 21 is a diagram showing an example of a case where the user selected "sales volume" among the selection menu of
20 "(C) profit related index" in the display menu for selecting the type of index;

FIG. 22 is a diagram showing a display example of an enterprise value evaluation input condition setting screen for selecting the conditions of the "target document" and "reading
25 of data" upon calculating the index for determining the enterprise value;

FIG. 23 is a diagram showing a display example of an enterprise value evaluation input condition setting screen for selecting the conditions of the target industry or respective enterprises upon calculating the index for determining the enterprise value;

FIG. 24 is a diagram showing an output condition setting screen of the calculated index;

FIG. 25 is a diagram showing a state where the user selected "(A) investment index" in the display menu for selecting the type of index;

FIG. 26 is a diagram showing an example where the user selected "investment trend index" from the selection menu of "(C) investment index" in the display menu for selecting the type of index;

FIG. 27 is a diagram showing an example where the user selected the items of "(PA) patent application related index" in the display menu for selecting the type of index; and

FIG. 28 is a diagram showing an example where the user selected "number of claims filed" from the items of "(PA) patent application related index" in the display menu for selecting the type of index.

BEST MODE FOR CARRYING OUT THE INVENTION

[0028]

Embodiments of the present invention are now explained with reference to the drawings.

[0029]

FIG. 1 is a diagram showing the overall configuration of an enterprise evaluation system according to the present invention.

5 As shown in FIG. 1, the enterprise value evaluation system is configured from a database 20 recording various types of information such as management-finance information, technical documents (in addition to patent information, information relating to utility models and technical journals),
10 market value information (numerical value information of the market value), threshold for determining the validity of the enterprise value, determination result of the validity and category based on such threshold; an enterprise evaluation
15 device 30 for inputting various types of information such as management-finance information, technical documents and market value information and outputting the judgment results of the validity of the enterprise value; and a communication network
20 such as the Internet or dedicated communication line for communicably connecting the enterprise evaluation device 30 and database 20.

[0030]

Incidentally, the database 20 may be provided inside the enterprise evaluation device 30.

[0031]

25 FIG. 2 is a signal processing system block diagram of an enterprise evaluation device according to the present

invention.

As shown in FIG. 2, the information transmission-reception unit of the enterprise evaluation device 30 is provided with a transmission-reception means 365 (including the functions of a management-finance information acquisition means, gazette acquisition means or output means) for transmitting and receiving information to and from another telecommunications device via the communication network 364 such as a public line or telecommunications network.

[0032]

Further, the enterprise evaluation device 30 is also provided with an input interface 371 for acquiring various types of information input by the user via the input means 370 and transmitting this to the information processing means described later, and outputting display commands to an LCD or the like based on instructions from the information processing means, a display means 372 for displaying information such as images or texts, graphs or charts, a display interface 373 (including the function of an output means) for outputting image signals for display to the display means 372 based on the command from the information processing means, and a printer interface 374 for outputting information such as images or texts, graphs or charts to a printer 32 or the like. Incidentally, the input means 370 includes input devices such as a keyboard, mouse, tablet and the like.

[0033]

Further, the enterprise evaluation device 30 is also provided with a recording medium mounting unit 378 for detachably mounting a recording medium 377, and a recording medium interface 379 (including the functions of a management-
5 finance information acquisition means, gazette acquisition means or output means) for recording and reading various types of information in and from the recording medium 377.

Incidentally, the recording medium 377 is a detachable recording medium in a magnetic recording format or optical
10 recording format as represented by semiconductors such as a memory card, MO, magnetic disk and so on.

[0034]

Moreover, the enterprise evaluation device 30 is also provided with an information processing means 380 for
15 controlling the overall enterprise evaluation device 30, and a memory 381 configured from a ROM recording programs to be executed by the information processing means 380 and various constants, or a RAM which is a recording means to become the working area upon the information processing means 380
20 executing processing.

[0035]

Further, the information processing means 380 is able to realize the various functions of a management-finance information acquisition means, gazette acquisition means,
25 number-of-inventions acquisition means, number-of-extinguished-inventions acquisition means, total number-of-

effective-patents calculation means, total effective patent
remaining ratio calculation means, number of inventions per
applicant acquisition means, number of registered inventions
acquisition means, remaining period calculation means, patent
5 stock index calculation means, remaining period per applicant
calculation means, average remaining period of total effective
patents calculation means, display data generation means and
output means. Incidentally, instead of the information
processing means 380 performing all of the processing to be
10 performed by the foregoing means, a plurality of dedicated
processing devices may be provided so that the respective
processing devices can share and execute such processing in
order to achieve the objects of the present invention.

[0036]

15 Moreover, the enterprise evaluation device 30 is also
provided with a recording means 384 such as a hard disk
recording various types of information; for example, various
constants relating to the processing of the enterprise
evaluation device 30, attribute information upon communicably
20 connecting to a telecommunications device on a network,
connection information such as a URL (Uniform Resource
Locators), gateway information, DNS (Domain Name System),
management-finance information relating to the management of
the enterprise, technical documents relating to patents,
25 market value information, threshold for determining the
enterprise value and determination results based on such

threshold; recording means interface 385 (including the functions of a management-finance information acquisition means, gazette acquisition means or output means) for reading information recorded in the recording means 384 and writing
5 information to the recording means 384; and a calendar clock 390 for clocking the time.

[0037]

The respective peripheral circuits of the information processing means 380, display interface 373, memory 381,
10 recording means interface 385 and calendar clock 390 in the enterprise evaluation device 30 is connected to a bus 399, and the respective peripheral circuits can be controlled based on the processing program to be executed by the information processing means 380.

15 [0038]

Incidentally, various databases of the management-finance information, technical documents and market value information may be stored in the recording means 384, provided by the storage medium 377 such as a CD-ROM, CD-RW, DVD or MO, or
20 acquired from another telecommunications device (database 20 or the like) via the communication network 364.

[0039]

Further, the enterprise evaluation device 30 can be realized by using various types of computers such as a
25 personal computer or workstation. Moreover, computers may be connected via a network to share and implement the functions.

[0040]

The management-finance information acquisition means of the transmission-reception means 365, recording means interface 385, recording medium interface 379 and information
5 processing means 380 is capable of acquiring management-finance information such as the sales volume in a period to be researched from a management-finance information database (database 20, recording means 384, recording medium 377 or the like) recording information showing the size of the enterprise
10 to be researched or management-finance information such as the finance information of the enterprise.

[0041]

In addition, the gazette acquisition means of the transmission-reception means 365, recording means interface
15 385, recording medium interface 379 and information processing means 380 is capable of acquiring technical documents in an enterprise to be researched, technical field to be researched or period to be researched from a technical document database (database 20, recording means 384, recording medium 377 or the
20 like).

[0042]

Further, the gazette acquisition means of the transmission-reception means 365, recording means interface 385, recording medium interface 379 and information processing
25 means 380 is capable of acquiring registration gazettes for patents surviving up to a predetermined time among the patent

applications filed by a specified enterprise in a predetermined technical field within a specified period from a database (database 20, recording means 384, recording medium 377 or the like).

5 [0043]

Moreover, the gazette acquisition means of the transmission-reception means 365, recording means interface 385, recording medium interface 379 and information processing means 380 is capable of acquiring registration gazettes such as patent registration gazettes, publications of examined patent applications, publications of examined utility model applications or utility model registration gazettes, or unexamined publications such as publications of unexamined patent applications, published Japanese translations of PCT international applications for patents, publications of unexamined utility model applications or published Japanese translations of PCT international applications for utility models from a technical document database (database 20, recording means 384, recording medium 377 or the like).

20 [0044]

Further, the management-finance information acquisition means of the transmission-reception means 365, recording means interface 385, recording medium interface 379 and information processing means 380 is capable of acquiring the sales volume relating to patent applications filed by a specified enterprise in a predetermined technical field within a

specified period from a management-finance database (database 20, recording means 384, recording medium 377 or the like) storing management-finance information of an enterprise.

[0045]

5 Moreover, the output means of the transmission-reception means 365, recording means interface 385, recording medium interface 379, printer interface 374 and information processing means 380 is capable of outputting various indexes such as the total effective patent remaining ratio, patent
10 stock index and average remaining period of total effective patents to a display means, printing means, recording medium, or another telecommunications device via a communication line.

[0046]

 Further, the output means of the transmission-reception
15 means 365, recording means interface 385, recording medium interface 379, printer interface 374 and information processing means 380 is capable of outputting display data for associating the number of inventions and patent stock index for display, and display data for associating the sales volume
20 and patent stock index to a display means for display, printing means, recording medium, or another telecommunications device via a communication line.

[0047]

 Moreover, the number-of-inventions acquisition means of
25 the information processing means 380 and the like is capable of acquiring the number of patents subjected to, before a

predetermined time, registration or number of claims of the patents as the number of inventions from the acquired registration gazettes.

[0048]

5 Further, the number-of-extinguished-inventions acquisition means of the information processing means 380 and the like is capable of acquiring the number of extinguished inventions that extinguished before a predetermined time from the acquired number of inventions.

10 [0049]

Moreover, the total number-of-effective-patents calculation means of the information processing means 380 and the like is capable of calculating the total number of effective patents by subtracting the number of extinguished
15 inventions from the acquired number of inventions.

[0050]

Further, the total effective patent remaining ratio calculation means of the information processing means 380 and the like is capable of calculating the total effective patent
20 remaining ratio through dividing the calculated total number of effective patents by the number of inventions.

[0051]

Moreover, the number of inventions per applicant acquisition means of the information processing means 380 and
25 the like is capable of acquiring the number of patents subjected to registration or number of claims of the patents

as the number of registered inventions, acquiring the number
of applicants described in the acquired gazettes, and
acquiring the number of registered inventions per unit of
applicant through dividing the acquired number of registered
5 inventions by the number of applicants.

[0052]

Further, the number of registered inventions acquisition
means of the information processing means 380 and the like is
capable of counting the acquired number of registered
10 inventions per unit of applicant for the all acquired gazettes
and acquiring the total number of registered inventions as the
number of inventions.

[0053]

Moreover, the remaining period calculation means of the
15 information processing means 380 is capable of calculating a
term expiration date of each of rights of the acquired
registration gazettes, and calculating the remaining period by
subtracting the predetermined time from the term expiration
date.

20 [0054]

Further, the patent stock index calculation means of the
information processing means 380 and the like is capable of
calculating a patent stock index by counting the calculated
remaining period for all registration gazettes for patents
25 surviving up to the predetermined time.

[0055]

Moreover, the remaining period per applicant calculation means of the information processing means 380 and the like is capable of calculating a term expiration date of each of rights of the acquired registration gazettes, calculating a remaining period by subtracting the predetermined time from the term expiration date, acquiring the number of applicants described in each of the acquired gazettes, and calculating the remaining period per unit of applicant through dividing the remaining period by the number of applicants.

10 [0056]

Further, the average remaining period of total effective patents calculation means of the information processing means 380 and the like is capable of calculating the average remaining period of total effective patents through dividing the patent stock index by the number of registration gazettes for patents surviving up to the predetermined time.

[0057]

Moreover, the display data generation means of the information processing means 380 and the like is capable of generating display data for associating the number of inventions and patent stock index in a chart form or graph form for display.

[0058]

Further, the display data generation means of the information processing means 380 and the like is capable of generating display data for associating the sales volume and

patent stock index in a chart form or graph form for display.

[0059]

FIG. 3 is a chart representing an example of management-finance information recorded in the recording means of the database 20 or the like.

As shown in FIG. 3, management-finance information includes information showing the size of the company, information showing the financial information of the company, and combined information of the company calculated by combining the various types of information of the company. Incidentally, as the data of management-finance information, the annual security report of the company to be researched, and information acquired from commercial databases provided by newspaper publishers and research institutes may be used.

[0060]

Information showing the size of the company includes the number of employees, number of officers, capital, number of plants, number of offices, ground floor area, total floor area, ownership ratio of premises, ownership ratio of building, number of employees (consolidated basis), number of officers (consolidated basis), capital (consolidated basis), number of plants (consolidated basis), number of offices (consolidated basis), ground floor area (consolidated basis), total floor area (consolidated basis), ownership ratio of premises (consolidated basis) or ownership ratio of building (consolidated basis).

[0061]

The financial information of the company includes the sales volume, sales profit, operating profit, sales profit ratio, operating profit ratio, total market value to total assets ratio, total market value to stockholders' equity ratio, total market value to sales volume ratio, total market value to gross operating profit ratio, total market value to operating profit ratio, gross operating profit to total assets ratio, gross operating profit to stockholders' equity ratio, operating profit to total assets ratio, operating profit to stockholders' equity ratio, stockholders' equity ratio, balance of total market value and stockholders' equity, R&D cost, R&D cost to sales volume ratio, R&D cost to gross operating profit ratio, gross operating profit ratio or gross operating profit.

[0062]

The combined information of the company includes the sales volume per employee, R&D cost per employee, sales profit per employee, operating profit per employee, gross operating profit per employee and so on.

[0063]

The gross operating profit is now explained.

Pursuant to the revision of the accounting standards, as a general rule in Japan, R&D cost must be recorded entirely as expenses in the settlement of accounts after the term ending March 2000. Conventionally, there were numerous companies that

did not disclose the breakdown of the R&D cost included in the manufacturing costs and general administrative expenses.

Nevertheless, after the enforcement of these regulations, the amount of R&D cost pertaining to the calculation of profits

5 and losses became clear. Thereupon, for the purpose of multilaterally analyzing the actual status of such R&D cost of the company, and index referred to as the "gross operating profit" has been developed.

[0064]

10 This is an estimate of hypothetical profits (main business excluding research and development activities; that is, gross profit generated from the manufacture and sale activities) sought by adding the R&D cost to the operating profit. As a result of the R&D cost being entirely recorded as
15 expenses, upon calculating profits and losses, the more research and development activities are positively engaged, the more operating profit will be compressed. Thus, while the importance of technology development (intellectual property) is being discussed, there is a problem in that it is difficult
20 to grasp the actual condition of the profitability of the company only from the perspective of operating profit. The foregoing estimate is considered to provide a perspective to this problem.

[0065]

25 This gross operating profit is an index that is positioned roughly between the sales profit and operating

profit. By using the gross operating profit simultaneously with the sales profit and operating profit, it will be possible to grasp the profitability of the company from many angles.

5 [0066]

The sales profit is the gross margin sought by subtracting the manufacturing cost from the sales volume. Nevertheless, some R&D cost are included in manufacturing costs, whereas others are included in general administrative expenses. Thus, strictly speaking, the gross operating profit cannot be called a profit index positioned between the sales profit and operating profit. The relationship of the gross operating profit and other profit indexes can be represented with the formula indicated below.

15

Gross operating profit
= (sales profit) + (R&D cost included in the manufacturing costs) - {(general administrative expenses) - (R&D cost included in the general administrative expenses)}
20 = operating profit + R&D cost

[0067]

FIGS. 4A and 4B are diagrams showing an example of a technical document recorded in a recording means of the database 20 or the like.

25 As shown in FIGS. 4A and 4B, technical documents contain patent documents such as filing information and registration

information of patents and utility models. As data of technical documents, for instance, the Industrial Property Digital Library database of the Japanese Patent Office, information relating to patents and utility models acquired
5 from CD-ROM gazettes or other technical journals may be used.

[0068]

Application information of the present invention includes, for instance, per enterprise, the following: the filing date, application number, title of the invention, inventors,
10 applicants, scope of claims, abstract, IPC, FI, F Term, agents, publication date, publication number, existence of request for examination, date of request for examination, priority date, priority number, date of publication of translations of PCT international application, number for publication of
15 translations of PCT international application, date of domestic re-publication of PCT international application, number for domestic re-publication of PCT international application, international filing date, international application number, international publication date,
20 international publication number, designated country, number of filings, number of examinations requested, number of filings based on IPC, number of filings based on keywords, number of claims filed, years spent on examination requests, number of inventors, number of applicants (number of joint
25 applications), number of domestic priority-claiming applications, number of domestic priority bases claimed in

applications, number of priority bases from foreign countries,
number of applications in which an exception to loss of
novelty is requested, number of applications in which
examination is requested before laid-open, number of
5 divisional applications, number of withdrawn/abandoned
applications, number of converted applications, number of
expedited examinations, number of filings in each foreign
country, number of inventors in each foreign country, number
of applicants in each foreign country, number of priority-
10 claiming applications in each foreign country, and number of
priority bases claimed in applications in each foreign country
or number of divisional applications in each foreign country.

[0069]

Further, registration information of the present
15 invention includes, for example, per enterprise, the
following: the registration date, issue date of registration,
registration number, scheduled day of expiration of right,
date of publication of examined application, publication
number of examined application, annual maintenance fee payment
20 status, number of final decisions for rejection, date of final
decision for rejection, number of claims decided to be finally
rejected, number of appeals against final decision for
rejection, number of abandoned/withdrawn applications after
request for examination, number of abandoned/withdrawn claims
25 after request for examination, number of invalidation trials,
appeal/trial number, date of decision to appeal/trial, number

of claims demanded for invalidation trial, number of appeals
to dismissals of amendment or trials for correction, number of
oppositions, number of claims demanded for opposition,
inventors of registered patent, number of inventors of
5 registered patent, applicants of registered patent, references
cited, number of registrations, number of claims registered,
number of expired patents after registration, years spent from
application to registration, patent registration rate, patent
allowance rate, years spent from request for examination to
10 registration, number of applications in which preferential
examination is conducted, number of rejections issued, number
of amendments filed, number of amendments filed for
formalities, number of registrations for creating patent right,
number of registrations for extending term of patent right,
15 number of transferred patents, number of registrations in each
country, years required for registration in each country,
years spent on examination in each country, number of
rejections issued in each country, number of amendments filed
in each country, number of amendments filed for formalities in
20 each country, number of oppositions filed in each country,
number of applications in which preferential examination is
conducted or number of rejections issued.

[0070]

The respective indexes upon evaluating enterprises based
25 on the number of inventions are explained below.

[0071]

Generally, it is possible to judge that an enterprise with a large number of inventions such as the number of patent applications or the number of claims contained in patent applications or patents is allotting their budget to the development of new products, is active in product development toward the future, and is expected to expand its business or improve its profits in the future.

[0072]

Similarly, it is possible to judge that an enterprise with a large number of patents subjected to registration or large number of claims has exclusive technical strength for the future, and is expected to expand its business or improve its profits in the future.

[0073]

Industrial products in recent years are equipped with numerous functions for increasing the value as the product itself, and the technical fields required for product development are broadening in accordance with the function or performance of the product. Further, when designing the product by improving the function or performance in order to improve the competitive position, development costs thereof will also rise considerably, and a substantial amount of funding and personnel will also become required.

[0074]

If an enterprise that is creating numerous technical ideas for the development of new products and filing patent

applications to acquire patents has sufficient development funds, it is possible to judge that this enterprise is expected to expand its business or improve its profits in the future in light of the exclusive right upon obtaining the
5 patent.

[0075]

Further, investors and banks wish to invest in enterprises with a promising future, and students and mid-career engineers wish to be employed in an enterprise with
10 ingenious technical strength.

[0076]

The present invention provides several indexes that will become a criterion for investors, banks, engineers and others to search for enterprises with ingenious technical strength
15 and a promising future among a plurality of enterprises. Incidentally, in the present invention, although explanation is given regarding enterprises that filed patent applications, indexes may also be calculated for patent applications filed by natural persons in addition to enterprises.

20 [0077]

When reviewing unexamined publications of patent applications, there are many cases where a single patent application describes numerous novel inventions upon dividing the inventions into a plurality of claims. Based on this fact,
25 it is possible to consider the number of patent applications or number of claims to be the number of inventions.

Particularly in recent years, the number of claims included in a single patent application is of an increasing trend.

Nevertheless, it has been statistically proven that the number of claims included in a single patent application have

5 differing average values and trends depending on the technical field or business category, or per enterprise. Thus, if the trend analysis of patent applications of the respective enterprises, comparative assessment with other companies and analysis of technical strength are conducted simply with the
10 number of applications, there may be some cases where this may cause a considerable misunderstanding. Due to the foregoing reasons, the patent application trend and technical trend of the respective companies in the embodiments of the present invention are captured from both aspects of the number of
15 patent applications and the number of claims in a patent application.

[0078]

Incidentally, in the foregoing example, although the number of patent applications, the number of registered
20 patents or the number of claims thereof are used as number of inventions, the present invention is not limited thereto, and, as the number of inventions, the number of utility model registrations, number of claims registered, number of examination requests, number of claims requested for
25 examination, number of final decisions for registration, number of claims decided to be registered, number of final

decisions for rejection, number of claims decided to be rejected, number of demands for trial, number of claims demanded for trial and so on may also be used according to the intended purpose.

5 [0079]

Moreover, a value combining two or more number of inventions, for instance, (number of registrations/number of examination requests) may also be used according to the intended purpose.

10 [0080]

Further, although a case where IPC sub-classes are used as the technical field of the invention was described in the foregoing example, technical information is not limited to IPC sub-classes, and the classifications of IPC sections, classes, sub-classes, main groups, sub groups, F terms, FI, facets, keywords contained in the patent documents may also be used according to the intended purpose.

[0081]

FIG. 5 and FIG. 6 are charts illustrating examples of the respective indexes of "business, profit, market value" calculated by the enterprise evaluation device pertaining to the present invention and the calculating formula thereof.

[0082]

As shown in FIG. 5 and FIG. 6, as the index groups, "(A) investment", "(B) management-finance analysis", "(C) profit related", "(D) excess profit analysis", "(M) market value

related", and "(PE) patent profitability are provided, and the names and outline of the respective indexes and the calculating formula thereof are indicated in each of these groups.

5 [0083]

Further, FIG. 7 and FIG. 8 are charts illustrating examples of the index of "R&D, patent" calculated by the enterprise evaluation device pertaining to the present invention.

10 [0084]

As shown in FIG. 7 and FIG. 8, as the index groups, "(R) research and development related", "(PA) patent application related", "(PB) examination request related", "(PT) patent acquisition (registration) related", "(PP) patent productivity" and "(PS) patent stock related" are provided, and the names and outline of the respective indexes and the calculating formula thereof are indicated in each of these groups.

[0085]

20 FIG. 9 is a chart illustrating an example of the "patent portfolio" index calculated by the enterprise evaluation device pertaining to the present invention.

[0086]

As shown in FIG. 9, as the index groups, "(PAP) patent application portfolio analysis", "(PAK) characteristic keywords", and "(PSI) patent similarity ratio analysis" are

provided, and the names and outline of the respective indexes and the calculating formula thereof are indicated in each of these groups.

[0087]

5 Next, the respective indexes pertaining to the present invention are explained.

In the present invention, among the respective indexes shown in FIG. 8, the two broad classifications below and the respective indexes included in the lower hierarchy are
10 explained. Further, abbreviation of the respective indexes is defined as "patent stock related index (PS)" and so on.

[0088]

Patent Stock Related Index (PS)

- (1) Cumulative number of patent registrations (patent granted
15 stock; PTSP)
- (2) Total number of effective patents (PSTE)
- (3) Total effective patent remaining ratio (patent granted renewal ratio; PSRR)
- (4) Average remaining years of total effective patents (years
20 to renewal patent granted expiration (average); PSAR)
- (5) Patent stock index (PSIN)

Each of the indexes listed above is now explained.

[0089]

- 25 (1) Cumulative number of patent registrations (patent granted stock; PTSP)

Cumulative number of patent registrations (PTSP) is an index showing cumulative number of patent registrations (number of inventions) subjected to registration by a predetermined time among the patent applications filed by a specified enterprise within a specified period. The calculating formula thereof is shown below (Formula 1).

Cumulative number of patent registrations (PTSP)
= cumulative number of patent registrations subject to registration by a predetermined time among the patent applications filed by a specified enterprise within a specified period ... (Formula 1)

Provided,

"Specified period" shows a period such as from January 1, 1994 to December 31, 1996

"Predetermined time" shows the time of tabulation such as at the last day of the year 1999, the last day of the year 2000 or the last day of the year 2001

[0090]

Generally, cumulative number of patent registrations (PTSP) includes patents that lapsed due to the expiration of its term. However, patent rights may be subtracted based on those that were extinguished as a result of cancellation decision due to opposition or invalidation decision due to invalidation trial, or patent rights may be subtracted based

on those that were extinguished due to abandonment, withdrawal or rejection. Further, the number of patent registrations could be increased when subject to registration as a patent as a result of filing an appeal against the decision of rejection, but this is omitted here. It will be possible to judge that enterprises having a large value for the number of patent registrations (PTSP) are promptly making examination requests for patent applications and have acquired numerous patents.

[0091]

10 In the embodiment of the present invention, upon counting the cumulative number of patent registrations (PTSP), the patent applications filed in 1994 onward up to a predetermined time when publications and registrations are available in the Japanese Patent Office's CD-ROM gazettes were counted
15 regarding the patents subject to registration. If the data of patent publications and registrations can be obtained, these may be counted from an older year. Further, this is not limited to 1994 onward, and the respective indexes may be calculated by counting the data from a new year such as 2000
20 onward. When the cumulative number of patent registrations (PTSP) is counted from a recent year as described above, since a predetermined time will be required from the filing of patent applications to the grant thereof, there are cases where the number of patent registrations (PTRD) may be
25 calculated as a greater value.

[0092]

The number of patent registrations (PTRD) is obtained by the number-of-inventions acquisition means acquiring the number of patents subject to registration or number of claims of the patents as the number of inventions from registration gazettes (patent registration gazettes, publications of examined patent applications, publications of examined utility model applications, or utility model registration gazettes) of patents or utility models acquired from the database 20 or the like.

10 [0093]

(2) Total number of effective patents (PSTE)

Total number of effective patents (PSTE) is an index for showing the total number of patent registrations obtained by subtracting the total number of patents or utility model registrations that extinguished due to reasons such as expiration of term from the total number of patents or utility models (cumulative number of patent registrations (PTSP)) subject to registration before a predetermined time among the patent applications or utility model applications filed by a specified enterprise within a specified period. Therefore, the total number of effective patents (PSTE) represents the total number of registered patents or registered utility models based on patent applications or utility model applications filed within a specified period that are still existing at a predetermined time such as each year end. The calculating formula thereof is shown below (Formula 2).

Total number of effective patents (PSTE)

= (total number of patent registrations among patents filed by
a specified enterprise within a specified period) - (total
5 number of extinguished patents that extinguished by a
predetermined time among the patent registrations filed by a
specified enterprise within a specified period)

= Cumulative number of patent registrations (PTSP) - (total
number of extinguished patents that extinguished by a
10 predetermined time among the patent registrations filed by a
specified enterprise within a specified period) ...(Formula 2)

Provided,

"Specified period" shows a period such as from January 1, 1994
15 to December 31, 1996

"Predetermined time" shows the time of tabulation such as at
the last day of the year 1999, the last day of the year 2000
or the last day of the year 2001

[0094]

20 Upon calculating the foregoing total number of effective
patents (PSTE), for instance, the gazette acquisition means
acquires the registration gazettes based on patent
applications filed by a specified enterprise in a
predetermined technical field within a specified period from a
25 database. And, the number-of-inventions acquisition means
acquires the number of patents subjected to, within a

predetermined period, registration or number of claims of the patents as the number of inventions from the acquired registration gazettes. Further, the number-of-extinguished-inventions acquisition means acquires the number of
5 extinguished inventions that extinguished within a predetermined period from the acquired number of inventions. And, the total number-of-effective-patents calculation means calculates the total number of effective patents by subtracting the number of extinguished inventions from the
10 acquired number of inventions.

[0095]

Incidentally, upon calculating the total number of effective patents (PSTE), patent applications filed by a specified enterprise in a predetermined technical field within
15 a specified period may be targeted. Further, in the case of a co-owned patent right, the number of patents may be divided by the number of co-owners. Here, the number of inventions per applicant acquisition means acquires the number of patents subject to registration or number of claims of the patents as
20 the number of registered inventions, acquires the number of applicants described in the acquired gazettes, and acquires the number of registered inventions per unit of applicant through dividing the acquired number of registered inventions by the number of applicants. And, the number of registered
25 inventions acquisition means multiplies the acquired number of registered inventions per unit of applicant with the all

acquired gazettes and acquiring the total number of registered inventions as the number of inventions.

[0096]

Value of the total number of effective patents (PSTE) is increased by the number of patents newly subject to registration or newly registered utility models in each year, and is decreased by the number of patents or registered utility models that are extinguished in each year. Thus, when the number of extinguished registrations exceeds the number of new registrations, value of the total number of effective patents (PSTE) will decrease in comparison to the value of the previous year.

[0097]

Value of the calculated total number of effective patents (PSTE) may be considered to show the technical strength of an enterprise in a monopolistic state. Therefore, generally speaking, an enterprise having a large total number of effective patents (PSTE) value is considered to have superior patent or technical strength. Incidentally, in recent years, for the purpose of reducing patent administrative expenses, many enterprises are abandoning patents which are considered to be strategically insignificant, or rationalizing their strategy by carefully examining the subject matter of applications and thereby narrowing down the cases to be newly filed. Thus, it is necessary to keep in mind that the increase or decrease in the total number of effective patents (PSTE)

does not necessarily directly represent the increase or decrease in the value of the overall patent stock.

[0098]

(3) Total effective patent remaining ratio (patent granted
5 renewal ratio; PSRR)

The total effective patent remaining ratio (PSRR) is an index obtained through dividing the calculated total number of effective patents (PSTE) by the cumulative number of patent registrations that were granted by a predetermined time among
10 the patent applications filed by a specified enterprise within a specified period. The calculating formula thereof is shown below (Formula 3).

Total effective patent remaining ratio (PSRR)
15 = (total number of effective patents (PSTE)) / (cumulative number of patent registrations (PTSP)) ... (Formula 3)

Provided,

"Specified period" shows a period such as from January 1, 1994
20 to December 31, 1996

"Predetermined time" shows the time of tabulation such as at the last day of the year 1999, the last day of the year 2000 or the last day of the year 2001

[0099]

25 As shown in (Formula 3) above, upon calculating the total effective patent remaining ratio (PSRR), the total effective

patent remaining ratio calculation means calculates the total effective patent remaining ratio through dividing the total number of effective patents (PSTE) by the number of inventions (cumulative number of patent registrations (PTSP)). Further, upon calculating the total effective patent remaining ratio (PSRR), patent applications in a predetermined technical field filed by a specified enterprise within a specified period may be targeted. Further, in the case of a co-owned patent right, the number of patents may be divided by the number of co-owners.

[0100]

(4) Average remaining years of total effective patents (years to renewal patent granted expiration (average); PSAR)

Average remaining years of total effective patents (PSAR) is an index showing the average remaining period per patent right effectively remaining at a predetermined time. The calculating formula thereof is shown below (Formula 4).

Average remaining years of total effective patents (PSAR)

$$= [\sum_{p=1}^P \{(\text{expiration date of term of remaining patents}) - (\text{predetermined time})\}] / \{(\text{total number of effective patents (PSTE)}) \times (\text{average number of days in a year})\} \dots (\text{Formula 4})$$

Provided,

p: Respective effective patents of a specified enterprise subject to registration within a specified period and

remaining up to a predetermined time

P: Total number of the effective patents of the specified enterprise subject to registration within the specified period and remaining up to the predetermined time

- 5 Predetermined time: time of tabulation such as at the last day of the year 1999, the last day of the year 2000 or the last day of the year 2001

[0101]

Upon calculating the foregoing average remaining years of
10 total effective patents (PSAR), for instance, the gazette acquisition means acquires registration gazettes based on patent applications in a predetermined technical field filed by a specified enterprise within a specified period from a database. And, the remaining period calculation means
15 calculates a term expiration date of each of rights of the acquired registration gazettes, and calculates the remaining period by subtracting the predetermined period from the term expiration date. Further, the patent stock index calculation means calculates a patent stock index by counting the
20 calculated remaining period for all registration gazettes for patents surviving up to the predetermined period. And, the average remaining period of total effective patents calculation means calculates the average remaining period of total effective patents through dividing the patent stock
25 index by the number of registration gazettes for patents surviving up to the predetermined period. Incidentally, upon

calculating the remaining period, the number of claims described in the registration gazettes may be multiplied for calculating the remaining period. This is because the number of claims may also be considered to be the number of inventions.

[0102]

Excluding some exceptions, the term of patent rights expires in 20 years from the filing date thereof. Thus, an enterprise or technical field having a large value of average remaining years of total effective patents (PSAR) shows that it has numerous patents that were filed recently, and signifies that such enterprise or technical field will be in a monopolistic state for many years to come.

[0103]

Contrarily, an enterprise or technical field having a small value of average remaining years of total effective patents (PSAR) shows that it has numerous patents with a short remaining period, and represents the decline of monopolistic technical strength of that enterprise or technical field.

[0104]

(5) Patent stock index (PSIN)

Patent stock index (PSIN) is an index showing the total period of the remaining period of patent rights surviving at a predetermined time such as at each year end. The calculating formula thereof is shown below (Formula 5).

Patent stock index (PSIN)

$$= [\sum_{p=1}^P \{(\text{expiration date of term of remaining patent rights}) - (\text{predetermined time})\}] / (\text{average number of days in a year})$$

$$= (\text{total number of effective patents (PSTE)}) \times (\text{average}$$

5 remaining years of total effective patents (PSAR)) ...(Formula 5)

Provided,

“Predetermined time” shows the time of tabulation such as at
10 the last day of the year 1999, the last day of the year 2000
or the last day of the year 2001

[0105]

Upon calculating the foregoing patent stock index (PSIN),
for instance, the gazette acquisition means acquires
15 registration gazettes for patents surviving up to a
predetermined period among the patent applications in a
predetermined technical field filed by a specified enterprise
within a specified period from a database. And, the remaining
period calculation means calculates a term expiration date of
20 each of rights of the acquired registration gazettes, and
calculates the remaining period by subtracting the
predetermined period from the term expiration date. Further,
the patent stock index calculation means calculates a patent
stock index by counting the calculated remaining period for
25 all registration gazettes for patents surviving up to the
predetermined period. Incidentally, upon calculating the

remaining period, the number of claims described in the registration gazettes may be multiplied for calculating the remaining period.

[0106]

5 As shown in (Formula 5) above, the patent stock index (PSIN) shows the total remaining period of patent effectively remaining. Assuming that the total number of effective patents (PSTE) calculated among target enterprises to be compared is the same, it should be considered that the patent stock is
10 different depending on the individual length of the remaining period.

[0107]

Therefore, the patent stock index (PSIN) is quantification of the overall value obtained by multiplying
15 the average remaining years of total effective patents (PSAR) to the total number of effective patents (PSTE). As a result of using this patent stock index (PSIN), it is possible to compare the power of enterprises in retaining patents. An enterprise having a large patent stock index (PSIN) value has
20 many effectively surviving patents and long remaining period, and has strong, exclusive technical strength based on inventions such as patents. Contrarily, an enterprise having a small patent stock index (PSIN) value has few effectively surviving patents and short remaining period, and has small,
25 exclusive technical strength based on inventions.

[0108]

FIG. 10 and FIG. 11 show display examples of the patent stock related index of the present invention.

FIG. 10 is a chart comparably displaying the total number of effective patents (PSTE), total effective patent remaining ratio (PSRR), average remaining years of total effective patents (PSAR) and patent stock index (PSIN) of 10 companies belonging to the electrical equipment industry.

[0109]

Foremost, in the electrical equipment industry, it is possible to tell from FIG. 10 that Company MS has a large total number of effective patents (PSTE) value, and Company NC has the second largest value. It is possible to presume that both of these companies have twice the number of effective patents in comparison to other companies, and have strong monopolistic power with respect to patents.

[0110]

Moreover, according to FIG. 10, Company PI has a small total number of effective patents (PSTE) value. Thus, there is no choice but to say that this company has weak monopolistic power based on patents. Nevertheless, Company PI may have monopolistic power based on strong patents in other technical fields. Therefore, when conducting a research per technical field, there are cases where it may not be possible to accurately compare enterprises merely by reviewing the value of total number of effective patents (PSTE), but it is possible to make a comparison in a specified technical field.

[0111]

According to FIG. 10, Company SN and Company SH are enterprises having a high total effective patent remaining ratio (PSRR) value. Since the indexes of FIG. 10 are
5 calculated based on patent registration gazettes issued in 1994 onward, it is evident that Company SN is retaining 98.7% of its patents among the patents subject to registration which were filed in 1994 onward without abandoning the same. Further, Company SH is also retaining 95.3% of its patents among the
10 patents subject to registration which were filed in 1994 onward. Accordingly, it is possible to know that both companies are carefully retaining their patents subject to registration. From this fact also, it is possible to presume that both companies are acquiring patents of technically
15 important inventions.

[0112]

Contrarily, the calculated total effective patent remaining ratio (PSRR) of Company HT and Company NC are both 74.6%, and it is possible to know that these companies are
20 abandoning roughly 1/3 of their patents. From this, it is possible to assume that these companies acquired patents that were not technically effective, or, since the technical trend in these companies changed significantly, inventions that were important at the time of filing became obsolete in the product
25 strategy upon the registration thereof.

[0113]

Further, if the total effective patent remaining ratio (PSRR) value is small, this means that patent rights have been abandoned at an early stage in order to cut back on the annuity payment of patents, and it is possible to judge the trend of the enterprise to be researched with respect to its patent strategy.

[0114]

Moreover, according to FIG. 10, Company NC has a dominant value of average remaining years of total effective patents (PSAR), and such value at 10.9 years is an extremely high value in comparison to the other companies. This shows that Company NC is achieving registration of patent applications very quickly. For instance, with respect to the patent applications filed by Company NC, when calculating the index (average years required for registration (PTMY)) showing the average number of years required for the registration regarding the patents subject to registration among the patent applications filed in the year 2002, a short period of 3.9 years is obtained.

[0115]

The average years required for registration (PTMY) value of other companies in the electrical equipment industry is roughly 6.1 to 8.9 years. Therefore, when consideration the average years required for registration (PTMY) value of 3.9 years of Company NC, it is possible to judge that Company NC is able to realize the registration from the filing of patent

applications in an extremely short period of time, and this relates closely to the fact that the average remaining years of total effective patents (PSAR) value is also dominantly high.

5 [0116]

Contrarily, the average remaining years of total effective patents (PSAR) value of Company PI is small at 6.7 years. From this fact, it is possible to presume that if Company PI does not acquire new patents, its overall technical
10 strength will decline.

[0117]

Further, when observing the patent stock index (PSIN) value shown in FIG. 10, Company NC has a dominantly high numerical value in comparison to other companies. Although the
15 total number of effective patents (PSTE) value of Company NC was ranked second place in FIG. 10, since its average remaining years of total effective patents (PSAR) value is high, the numerical value shows that Company NC has monopolistic technical strength based on overall inventions.

20 [0118]

Company MS is the enterprise having the second highest patent stock index (PSIN) value. The total number of effective patents (PSTE) value of Company MS is also high. When considering these numerical values, Company NC and Company MS
25 have extremely strong monopolistic technical strength, and it could be said that these companies created a patent kingdom.

[0119]

Contrarily, the patent stock index (PSIN) value and total number of effective patents (PSTE) value of Company PI are both small, and the average remaining years of total effective
5 patents (PSAR) value is also small. Thus, it is possible to judge that Company PI is an extremely weak company in terms of monopolistic technical strength based on inventions.

[0120]

FIG. 11 is a chart comparably displaying the total number
10 of effective patents (PSTE), total effective patent remaining ratio (PSRR), average remaining years of total effective patents (PSAR) and patent stock index (PSIN) of 10 companies belonging to the chemical industry.

[0121]

15 In the chemical industry, it is possible to tell that Company MT has the largest total number of effective patents (PSTE) value, and Company MK has the second largest value. Although it is possible to presume that the Company MT and the Company MK comprehensively have monopolistic technical
20 strength, it is evident that the number of patents is one digit less in comparison to the total number of effective patents (PSTE) value of the electrical equipment industry in FIG. 10. Therefore, it is possible to read that there is a great difference in the total number of effective patents
25 (PSTE) value depending on the industry.

[0122]

The reason the total number of effective patents (PSTE) value of Company HK is small in FIG. 11 is considered to be because the total effective patent remaining ratio (PSRR) is low at 71.2%, and the patent rights are being abandoned at a relatively early stage. With respect to the total effective patent remaining ratio (PSRR), further to Company HK having abandoned roughly 1/3 of their patents as described above, Company SU and Company MT are also abandoning roughly 1/3 of their patents at a total effective patent remaining ratio (PSRR) of 74.2% and 74.3%. In the chemical industry also, it is possible to differentiate enterprises that are carefully retaining patents and enterprises that are abandoning patents at an early stage, and it is also possible to discover differences in the trend of the respective enterprises regarding patents.

[0123]

Further, as shown in FIG. 11, Company SK and Company KO are enterprises having a high total effective patent average remaining ratio (PSRR) value in the chemical industry. And the average remaining years of total effective patents (PSAR) value of both companies is respectively 9.6 years and 9.5 years, and it is possible to read that both companies are maintaining patents rights for a relatively long period of time.

[0124]

Moreover, when observing the patent stock index (PSIN)

shown in FIG. 11, Company KO is ranked first place with the highest value. Although the calculated total number of effective patents (PSTE) value of Company KO was ranked third place in FIG. 11, the patent stock index (PSIN) value is
5 ranked first place since the average remaining years of total effective patents (PSAR) value is large and the average term of patent rights is long.

[0125]

Company MT with the second highest patent stock index
10 (PSIN) value has the highest total number of effective patents (PSTE) value in FIG. 11. It is possible to know that both Company KO and Company MT have strong monopolistic technical strength. It could be said that such enterprises having a strong technical competitive position can be evaluated highly.

15 [0126]

Further, as shown in FIG. 11, since Company DN has a small value of average remaining years of total effective patents (PSAR) at 6.9 years, the patent stock index (PSIN) value is also small. Similarly, in the case of Company HK,
20 since the total number of effective patents (PSTE) value is small at 906 patents in comparison to other companies, the patent stock index (PSIN) value is also small. Like this, enterprises having a small patent stock index (PSIN) could lose the technical competition unless they immediately acquire
25 new patent right.

[0127]

FIG. 12 is a diagram showing the relationship of the patent stock index (PSIN) and total number of effective patents (PSTE) in the chemical industry.

[0128]

5 Further, FIG. 13 is a diagram showing the relationship of the patent stock index (PSIN) and total number of effective patents (PSTE) in the electrical equipment industry.

[0129]

In the examples shown in FIG. 12 and FIG. 13, the
10 positions of the respective companies are plotted with the horizontal axis (x axis) as the total number of effective patents (PSTE), and the vertical axis (y axis) as the patent stock index (PSIN). Incidentally, in FIG. 12 and FIG. 13, abbreviations such as HK and MT are provided in order to
15 identify the plotted companies. The straight line shown in FIG. 12 and FIG. 13 is a regression line showing the average value of the position of each of the plotted companies, and a primary regression line of a linear expression is represented at the upper part of FIG. 12 and FIG. 13.

20 [0130]

As shown in FIG. 12 and FIG. 13, in both the chemical industry and electrical equipment industry, there is a correlation where an enterprise having a large total number of effective patents (PSTE) value also has a large patent stock
25 index (PSIN) value. Accordingly, in order to achieve a large patent stock index (PSIN) value that can also be considered

the amount of total assets of patents, it is important to increase the total number of effective patents (PSTE).

[0131]

In the chemical industry shown in FIG. 12, the total
5 number of effective patents (PSTE) value of Company KO is relatively high, and the patent stock index (PSIN) value is also high. From this, it is possible to judge that Company KO has numerous existing patents and the term of patents is also long, and, therefore, has strong monopolistic technical
10 strength and strong power based on patent rights.

[0132]

Contrarily, in the cases of Company HK and Company KF shown in FIG. 12, the total number of effective patents (PSTE) value is small, and the patent stock index (PSIN) value is
15 also small. From this, it is possible to know that these companies have weak monopolistic technical strength and weak power based on patent rights.

[0133]

In the case of the electrical equipment industry shown in
20 FIG. 13, the total number of effective patents (PSTE) value of Company NC and Company MS is relatively large, and the patent stock index (PSIN) value is also large. From this, it is possible to judge that these companies have numerous existing patents and the term of patents is also long, and, therefore,
25 has strong monopolistic technical strength and strong power based on patent rights.

[0134]

Nevertheless, when comparing Company NC and Company MS, although there is no significant difference in the total number of effective patents (PSTE), Company NC such a much higher value when comparing the patent stock index (PSIN) values. From this, it is possible to know that patents of Company NC have a much longer term than the patents of Company MS.

[0135]

In the case of Company PI in FIG. 13, the total number of effective patents (PSTE) value is small, and the patent stock index (PSIN) is also small. From this, it is possible to consider that this company has weak monopolistic technical strength based on inventions in comparison to the other companies shown in FIG. 13, and that it is extremely weak in terms of patents.

[0136]

FIG. 14 is a diagram showing the relationship of the patent stock index (PSIN) and sales volume in the chemical industry and electrical equipment industry.

[0137]

In FIG. 14, the positions of the respective companies are plotted by representing the patent stock index (PSIN) with a logarithm on the horizontal axis, and representing the sales volume (SALES) with a logarithm on the vertical axis. The straight line of both logarithm scales shown in FIG. 14 is a

regression line showing the dispersion of positions of each of the plotted companies, and the calculating formula of such regression line is shown at the upper part of FIG. 14.

Incidentally, in FIG. 14, abbreviations such as AK and MS are
5 provided in order to identify the plotted companies.

[0138]

In FIG. 14, upon plotting and observing the distribution of each company in the chemical industry and electrical equipment industry, it is possible to read that both the
10 chemical industry and electrical equipment industry have a similar correlation. Most of the companies dispersed at the upper right portion of the regression line shown in FIG. 14 belong to the electrical equipment industry, and all of the companies excluding Company PI (electrical equipment industry)
15 distributed at the lower left portion are companies belonging to the chemical industry.

[0139]

As shown in FIG. 14, when representing the relationship of the patent stock index (PSIN) and sales volume (SALES)
20 based on industry in a chart, it is evident that this can be classified fairly clearly. Further, as shown in FIG. 14, when representing both the patent stock index (PSIN) and sales volume (SALES) on both logarithm graphs, the respective companies in the electrical equipment industry and chemical
25 industry tend to be distributed roughly in a straight line. From this, an enterprise having a large patent stock index

(PSIN) value tends to have a large sales volume (SALES), and, contrarily, an enterprise having a small patent stock index (PSIN) value tends to have a small sales volume (SALES).

[0140]

5 In other words, according to FIG. 14, in a case where a certain enterprise wishes to increase its sales volume (SALES), generally speaking, it is necessary to increase the number of patent rights that it owns. And, it could be said that the increase in the number of owned patent rights will lead to the
10 increase in the sales volume.

[0141]

Moreover, enterprises positioned above the regression line shown in FIG. 14 have effective patent rights, and therefore, it is possible to consider that these enterprises
15 are increasing their sales volume. Further, it is also possible that these enterprises are increasing their sales volume since they have strong sales force based on brands.

[0142]

Meanwhile, it is possible to judge that enterprises
20 positioned below the regression line are focusing on research and development but not leading to increase in sales, or the sales volume is not increasing since these enterprises are not effectively utilizing their intellectual property.

[0143]

25 As shown in FIG. 14, although Company NC has the highest patent stock index (PSIN) value in the electrical equipment

industry, it is positioned below the regression line.

Therefore, in the case of Company NC, it is possible to read that its sales volume (SALES) is not that high in comparison to its patent stock index (PSIN) value.

5 [0144]

In the case of Company MS in the electrical equipment industry, it has a high patent stock index (PSIN) value and high sales volume. Company MS is positioned right on the regression line showing the average value of the respective
10 companies, and it is possible to judge that Company MS is a company having an average monopolistic technical strength based on inventions.

[0145]

Further, each of the companies TS, HT, FJ and SN shows in
15 FIG. 14 is positioned above the regression line representing the average value. From this, it is possible to read that these companies have a high sales volume (SALES) in comparison to the patent stock index (PSIN) value.

[0146]

20 Moreover, Company SH and Company SY shown in FIG. 14 are both positioned below the regression line representing the average value. From this, it is possible to read that these companies have a low sales volume (SALES) in comparison to the patent stock index (PSIN) value.

25 [0147]

Further, Company PI shown in FIG. 14 has an extremely low

patent stock index (PSIN) and a low sales volume in the electrical equipment industry. Nevertheless, when comparing this company with the other companies belonging to the chemical industry, although the patent stock index (PSIN) value is somewhat low, it is positioned above the regression line representing the average value in terms of the sales volume. Therefore, Company PI should not necessarily be judged as being inferior.

[0148]

As described above, when comparing the relationship of the patent stock index (PSIN) and sales volume including different industries, it is evident that there may be cases where a different judgment result is obtained in comparison to cases where comparison is made within the same industry. Therefore, it is necessary to keep this in mind when making a comparison with other business categories, and it can also be said that it is difficult to directly compare companies across different industries.

[0149]

Further, as shown in FIG. 14, the patent stock index (PSIN) value and sales volume value of the respective enterprises belonging to the chemical industry are smaller than the values of the electrical equipment industry. Further, in the chemical industry, it is possible to read that Company AK has a high sales volume in comparison to its patent stock index (PSIN) value. Moreover, Company SU and Company DN are

positioned above the regression line representing the average value, and both companies are showing a high sales volume in comparison to the patent stock index (PSIN) value.

[0150]

5 Further, in the chemical industry, the respective companies of KO, MT, SK, SE, KF and HK are positioned below the average line, and it is possible to read that 6 companies, which is 3 companies more than the 3 companies falling below average in the electrical equipment industry, are located
10 below the regression line. As a result of illustrating this on a graph, it is possible to clearly read the differences per industry and per enterprise, and more accurately conduct enterprise value evaluation.

[0151]

15 FIG. 15 shows a flowchart of calculating and outputting the respective indexes of total number of effective patents, total effective patent remaining ratio, average remaining years of total effective patents or patent stock index.

[0152]

20 At S501 "select enterprise for enterprise value evaluation", the information processing means 380 receives the input of a display command of a screen for selecting an enterprise from a user via the input means 370 such as a keyboard and the bus 399. The information processing means 380
25 reads the display data upon selecting the enterprise from the recording means 384 based on such command, converts this into

a display image signal, and outputs such signal to the display interface 373. The display interface 373 that acquired the display data from the information processing means 380 converts and outputs the display data corresponding to the display means 372. The display means 372 displays a screen based on the display data input from the display interface 373 and notifies the user.

[0153]

The user, while viewing the company selection screen displayed on the display means 372, inputs the information for specifying one or more enterprises to be researched via the input means 370. Here, the information to be input may be the enterprise name, enterprise code, or an enterprise may be selected from the enterprise selection screen. Information for specifying the enterprise input by the user via the input means 370 is read by the information processing means 380 via the bus 399.

[0154]

When the information processing means 380 receives the input of enterprise specifying information, the information processing means 380 reads the display data of the display menu for selecting the type of index to evaluate the enterprise value from the recording means 384, converts this into a display image signal, outputs such signal to the display interface 373, and, for example, displays the enterprise value evaluation menu shown in FIG. 16 on the

display means 372.

[0155]

Next, at S502 "select menu for enterprise value evaluation", the user, while viewing the enterprise value evaluation menu displayed on the display means 372, selects
5 the desired index for evaluating the enterprise value and inputs such index.

[0156]

When selecting an index from the enterprise value evaluation menu shown in FIG. 16 upon judging the enterprise
10 value, the user selects a desired index from the selection menu of "business, profit, market value" or "R&D, patent", or "patent portfolio". In the example shown in FIG. 16, the user is selecting the item of "(PT) patent acquisition
15 (registration) related index" belonging to the field of "R&D, patent".

[0157]

When the user inputs information for selecting the index of "R&D, patent", such input information is conveyed to the
20 information processing means 380, the command for displaying a selection mark at the portion of the index selected by the user is output to the display interface 373, and information for displaying the respective indexes existing at a lower level in the form of a pulldown menu is output to the display
25 interface 373. Incidentally, in the example shown in FIG. 16, the mark of the selected item is changed from a white square

to a black square.

[0158]

FIG. 17 shows a display example displaying the respective indexes existing in a lower level of "R&D, patent" in the form
5 a pulldown menu.

[0159]

The user selects a desired index to be calculated from the respective indexes displayed on the display means 372. With the example illustrated in FIG. 17, the user is selecting
10 the index of "number of patent registrations (PTRD)" representing the number of patents of a specified enterprise subject to the registration within a specified period.

[0160]

Further, when the user wishes to calculate the "(PS)
15 patent stock related index" falling under the field of "R&D, patent", as shown in FIG. 18, the user will select "(PS) patent stock related index" from the pulldown menu.

[0161]

When the user inputs information for selecting the "(PS)
20 patent stock related index", the information processing means 380 that acquired such input information outputs a command for displaying a selection mark at the portion of the index selected by the user to the display interface 373, and, outputs information for displaying the respective indexes
25 belonging to a lower level of the "(PS) patent stock related index" as shown in FIG. 19 to the display interface 373 in the

form of a pulldown menu.

[0162]

The user inputs information for selecting the index of "patent stock index" from the pulldown menu displayed as shown
5 in FIG. 19. Then, this input information is conveyed to the information processing means 380. The information processing means 380 sets a flag for deciding the parameter of the index to be calculated, displays a selection mark at the portion of the index selected by the user, and notifies the user of the
10 set information.

[0163]

When the user wishes to conduct a research upon mutually associating the indexes of inventions and the business, profit or market value information of a predetermined enterprise, the
15 user selects "(C) profit related index" from the selection menu of "business, profit, market value" shown in FIG. 20. Then, the information processing means 380 outputs a command for displaying on the display means 372 the pulldown menu indicating the items relating to the "(C) profit related
20 index" shown in FIG. 21. The user selects a desired profit index from the pulldown menu displayed on the display means 372. In the example shown in FIG. 21, a case where the "sales volume" is selected is shown.

[0164]

25 When the user inputs information for selecting the item of "sales volume" of "(C) profit related index", such input

information is conveyed to the information processing means 380. The information processing means 380 sets a flag for deciding the operation formula for calculating the index, displays a selection mark at the portion of the index selected
5 by the user, and notifies the user of the set information.

[0165]

When the user selects the "set" button and the selection processing of the type of index for evaluating the enterprise value is ended, the information processing means 380 reads the
10 display data of the display screen for setting the input conditions upon evaluating the enterprise value from the recording means 384, converts this into a display image signal, and outputs such signal to the display interface 373, and, for example, displays on the display means 372 the enterprise
15 value evaluation input condition setting screen shown in FIG. 22.

[0166]

The user, while viewing the enterprise value evaluation input condition setting screen displayed on the display means
20 372, selects and inputs the desired conditions for evaluating the enterprise value.

[0167]

For example, the user, based on the display of the enterprise value evaluation input condition setting screen
25 shown in FIG. 22, selects the conditions of "target document" and "reading of data" upon calculating the index for judging

the enterprise value. In the example shown in FIG. 22, the user is selecting "unexamined patent applications" and "registered patents" as the conditions of the "target document". Moreover, in the example shown in FIG. 22, the user is selecting "Internal DB1" as the condition of "reading of data".

[0168]

When the user inputs the various conditions of "target document" and "reading of data", such input information is conveyed to the information processing means 380. The information processing means 380 sets a flag of the items input by the user regarding the conditions of the "target document" and "reading of data", displays a selection mark at the portion of the index selected by the user, and notifies the user of the set information.

[0169]

When the user selects the "set" button and the input regarding the conditions of the "target document" and "reading of data" is completed, the information processing means 380 subsequently reads the display data of the enterprise value evaluation input condition setting screen shown in FIG. 23 from the recording means 384, and outputs a command for displaying this on the display means 372 via the display interface 373.

[0170]

The user, while viewing the enterprise value evaluation

input condition setting screen displayed on the display means
372, selects a desired enterprise to be evaluated. In the
example shown in FIG. 23, the user is selecting "electrical
equipment industry" among the "industries" to become the large
5 classification among the target of enterprise evaluation.
Further, the user may also select "enterprise" as the detailed
classification of individual enterprises among the target of
enterprise value evaluation, and designate input conditions
such as the "enterprise name", "enterprise code", "applicant
10 code" and so on. When the user, while viewing this screen,
selects the "target" on the right side and further selects the
enterprise, such user will input the enterprise name or
enterprise code and applicant code.

[0171]

15 When the user selects the "set" button and ends the input
condition setting of the enterprise value evaluation, such
input information is conveyed to the information processing
means 380. The information processing means 380 sets a flag of
the enterprise to become the "target" input by the user,
20 displays a selection mark at the portion of the index selected
by the user, displays information such as the set enterprise
name, enterprise code and applicant code on the display means
372, and notifies the user of the set information.

[0172]

25 When the user selects the "set" button and the setting of
the input conditions of the enterprise value evaluation is

ended, the information processing means 380 subsequently reads the display data of the enterprise value evaluation output condition setting screen shown in FIG. 24 from the recording means 384, and outputs a command for displaying this on the display means 372 via the display interface 373. The user, while viewing the enterprise value evaluation output condition setting screen displayed on the display means 372, selects a desired display mode. In the example shown in FIG. 24, "single map" is selected as the information relating to the "map position", the "patent application productivity" is selected as the "output data", and "upper 20" is selected as the volume of information to be output and displayed.

[0173]

When the user wishes to conduct a research upon mutually associating "business, profit, market value" and "R&D, patent", the user selects "(A) investment index" from the selection menu of "business, profit, market value" shown in FIG. 25. Then, the information processing means 380 outputs a command for displaying on the display means 372 the pulldown menu indicating the items relating to the "(A) investment index" shown in FIG. 26. The user selects a desired profit related index from the pulldown menu displayed on the display means 372. In the example shown in FIG. 26, a case where the "investment trend index" is selected is shown.

[0174]

When the user inputs information for selecting the item

of "investment trend index" related to "(A) investment index", such input information is conveyed to the information processing means 380. The information processing means 380 sets a flag for deciding the operation formula for calculating the index, displays a selection mark at the portion of the index selected by the user, and notifies the user of the set information.

[0175]

The screen shown in FIG. 27 illustrates an example where the selected the item of "(PA) patent application related index" from the selection menu of "R&D, patent". When the user selects the item of "(PA) patent applications", the pulldown menu shown in FIG. 28 is displayed on the display means 372. In the example shown in FIG. 28, a state is shown where the "number of claims filed" is selected from the selection menu of "(PA) patent application related index".

[0176]

When the user selects the "set" button and the setting of the enterprise value evaluation output conditions is ended, processing to the performed by the information processing means 380 proceeds to the processing of S503 "select combination" shown in FIG. 15. When the user designates the implementation of operation relating to management-finance information such as "business, profit, market value", the processing to be performed by the information processing means 380 proceeds to the processing of S604 "acquire management-

finance information", and, when the user designates the implementation of operation of "R&D patent" or "patent portfolio", the processing to be performed by the information processing means 380 proceeds to the processing of S504

5 "acquire patent information" shown in FIG. 15.

[0177]

Incidentally, when the user only designates an independent operation of the "number of patent registrations" or the like, the information processing means 380 does not
10 select the combination processing and implements only the processing of S504 onward.

[0178]

For example, when the user designates the operation of the "number of patent registrations" from the selection menu
15 of "R&D, patent", at S504, the information processing means 380 acquires the patent gazettes of the respective enterprises and information relating thereto from the database 20 based on the operation processing of the "R&D, patent" and information relating to the designated enterprise, and performs processing
20 for extracting the IPC sub-classes, number of patent applications, number of claims in a patent application and other information required for the operation. After the acquisition processing of patent information is ended, the processing to be performed by the information processing means
25 380 proceeds to the processing of subsequent S505 "calculate patent information".

[0179]

At S505, the information processing means 380 performs processing for calculating the desired index of the user based on the patent information acquired at S504, the operation
5 formula of "R&D, patent" input by the user, and the calculating formula to which a flag has been set based on the enterprise name or the like.

[0180]

When the operation processing of the index relating to
10 patents is ended at S505, the processing to be subsequently performed by the information processing means 380 proceeds to the processing of S506 "organize calculation result of patent information".

[0181]

15 At S506, the information processing means 380 classifies the specified enterprise into a predetermined category based on the operation result of the index relating to patents, and further performs operation processing for predetermined ranking or discrimination, and then organizes the various
20 operation results.

[0182]

When the organization of the various operation results is ended at S506, the processing to be performed by the information processing means 380 proceeds to the subsequent
25 processing of S507 "create graph".

[0183]

Meanwhile, in a case where the user selects "(A)
investment index" from the "business, profit, market value"
(refer to FIG. 26), and further selects "investment trend
index", and desires the combination of the operation of "R&D,
5 patent" and other items such as the "business, profit, market
value", the processing to be performed by the information
processing means 380 proceeds to S604 "acquire management-
finance information".

[0184]

10 At S604, the information processing means 380 acquires
various types of information from the database 20 such as the
information showing the size of the enterprise, finance
information of the enterprise, and combined information of the
enterprise, and operates the management-finance information at
15 the subsequent S605 "calculate management-finance information".

[0185]

When the operation processing of management-finance
information is ended at S605, the processing to the
subsequently performed by the information processing means 380
20 will proceed to S606 "organize calculation result of
management-finance information" in order to perform the
operation processing of management-finance information, and
then the routine proceeds to the subsequent S507.

[0186]

25 At S507, the information processing means 380 creates a
chart or graph by applying the operation result of the patent

information calculated at S505, various operation results organized at S506, operation result of the management-finance information operated at S605, or operation result of the various types of management-finance information organized at
5 S606 into a display format according to the index or the operation result thereof, and converts this into display data.

[0187]

Next, at S508 "output graph", the information processing means 380 outputs the display data of the chart or graph
10 created at S507 to the display interface 373, and displays this on the display means 372.

[0188]

By the user perusing the chart or graph display at S508, the user will be able to easily and accurately judge, with a
15 unique index, the enterprise value based on the diversification of inventions in the respective enterprises, competitive position relating to inventions, validity of the enterprise value, or the relationship between such unique information concerning inventions and the management-finance
20 information.

[0189]

Depending on the items of enterprise evaluation designated by the user, there may be cases where the information processing means 380 performs a more detailed
25 ranking in order to judge the enterprise value. In such a case, the information processing means 380 will read the

predetermined threshold or the like at S509 "determine enterprise value" to judge the enterprise value, thereafter output the numerical value or graph thereof, and then end the calculation processing of the various indexes.

5

Industrial Applicability

[0190]

The present invention comprises:

gazette acquisition means for acquiring registration
10 gazettes based on patent applications filed by a specified enterprise within a specified period;

number-of-inventions acquisition means for acquiring the number of patents subjected to, before a predetermined time, registration or number of claims of the patents as the number
15 of inventions from the acquired registration gazettes;

number-of-extinguished-inventions acquisition means for acquiring the number of extinguished inventions that extinguished before a predetermined time from the acquired number of inventions;

20 total number-of-effective-patents calculation means for calculating the total number of effective patents by subtracting the number of extinguished inventions from the acquired number of inventions;

total effective patent remaining ratio calculation means
25 for calculating the total effective patent remaining ratio through dividing the calculated total number of effective

patents by the number of inventions; and

output means for outputting the calculated total effective patent remaining ratio to display means, printing means, recording medium, or another telecommunications device
5 via a communication line.

Therefore, it is possible to know the attitude of enterprises to patents.

For instance, it is possible to judge that an enterprise having a high total effective patent remaining ratio is
10 carefully and effectively utilizing the granted patents.
Contrarily, it is possible to assume that an enterprise having a low total effective patent remaining ratio has abandoned its patents since the technical field became obsolete at the time of registration and such patents became unnecessary at an
15 early stage, or this technical field became unnecessary since the enterprise changed courses to a different technical field, and it is thereby possible to judge that such enterprise filed wasteful applications and examination requests, and was
20 granted patents without giving sufficient consideration at the time of filing.

[0191]

Further, according to the present invention,

the number of inventions per applicant acquisition means acquire the number of patents subjected to, before a
25 predetermined time, registration or number of claims of the patents as the number of registered inventions from each of

said acquired registration gazettes, and acquire the number of applicants described in each of said acquired gazettes, and acquire the number of registered inventions per unit of applicant through dividing said acquired number of registered inventions by the number of applicants.

Moreover, the number of registered inventions acquisition means count said acquired number of registered inventions per unit of applicant for said all acquired gazettes and acquiring the total number of registered inventions as the number of inventions.

Therefore, even if the technology becomes sophisticated and complex and the number of joint inventions and joint applications increases, it is possible to accurately judge the number of registered inventions of an enterprise and improve the reliability of data.

[0192]

Further, according to the present invention, the gazette acquisition means of the present invention acquire registration gazettes based on patent applications in a predetermined technical field filed within a specified period by a specified enterprise from a database.

Therefore, it is possible to evaluate the patents of an enterprise upon specifying a predetermined technical field.

[0193]

Further, the present invention comprises:
gazette acquisition means for acquiring registration

gazettes for patents surviving up to a predetermined time among the patent applications filed by a specified enterprise within a specified period from a database;

remaining period calculation means for calculating a term
5 expiration date of each of rights of said acquired registration gazettes, and calculating the remaining period by subtracting the predetermined time from said term expiration date;

patent stock index calculation means for calculating a
10 patent stock index by counting said calculated remaining period for all registration gazettes for patents surviving up to the predetermined time; and

output means for outputting said calculated patent stock index to display means, printing means, recording medium, or
15 another telecommunications device via a communication line.

Therefore, it is possible to compare the power of enterprises for retaining patents by using a patent stock index.

An enterprise having a high patent stock numerical value
20 has many effectively surviving patents and long remaining period, and has strong, exclusive technical strength based on inventions such as patents. Contrarily, an enterprise having a small patent stock numerical value has few effectively
surviving patents and short remaining period, and has small,
25 exclusive technical strength based on inventions.

[0194]

Further, the present invention calculates the patent stock index based on the patent applications in a predetermined technical field filed by a specified enterprise.

Therefore, it is possible to compare the patent stock index among competitors per technical field. Thereby, it is possible to grasp the exclusivity of technical strength of inventions per technical field, and use this as information for deciding whether it would be more effective for one's company to participate in a new technical field, or to acquire licenses through assignment or negotiation of patent rights from other companies.

[0195]

Further, the patent stock index calculation means of the present invention calculate a patent stock index by counting said calculated remaining period for all registration gazettes for patents surviving up to the predetermined time, and dividing the same by the average number of days of one year or one month.

Therefore, the user is able to recognize the patent stock index in units of years or months and instantaneously understand the same, and it is possible to display this to the user in an easy-to-view manner. For example, if the patent stock index per patent right is 3652.4 days, this is notified to the user as 10 years or 120 months.

[0196]

Further, the present invention comprises:

gazette acquisition means for acquiring registration gazettes for patents surviving up to a predetermined time among the patent applications filed by a specified enterprise within a specified period from a database;

5 remaining period calculation means for calculating a term expiration date of each of rights of said acquired registration gazettes, and calculating the remaining period by subtracting the predetermined time from said term expiration date;

10 patent stock index calculation means for calculating a patent stock index by counting said calculated remaining period for all registration gazettes for patents surviving up to the predetermined time;

average remaining period of total effective patents
15 calculation means for calculating the average remaining period of total effective patents through dividing said patent stock index by the number of registration gazettes for patents surviving up to said predetermined time; and

output means for outputting said calculated average
20 remaining period of total effective patents to display means, printing means, recording medium, or another telecommunications device via a communication line.

Therefore, it is possible to judge whether or not an enterprise recently filed numerous patent applications. And it
25 is also possible to judge whether or not the monopoly situation of such enterprise or technical field will continue

for many years.

[0197]

Further, according to the present invention, the average remaining period of total effective patents is calculated
5 based on the patent applications per predetermined technical field in a specified enterprise.

Therefore, it is possible to compare the average remaining period of total effective patents among competitors per technical field.

10 Thereby, it is possible to grasp the exclusivity of technical strength of inventions per technical field, and use this as information for deciding whether it would be more effective for one's company to participate in a new technical field, or to acquire licenses through assignment or
15 negotiation of patent rights from other companies.

[0198]

Moreover, according to the present invention, patent registration gazettes, publications of examined patent applications, publications of examined utility model
20 applications or utility model registration gazettes are used as the registration gazettes.

Therefore, it is possible to conduct an accurate enterprise evaluation based on broader technical documents.

[0199]

25 Further, according to the present invention, the display data generation means acquire the number of extinguished

inventions of patents extinguished before the predetermined time among the number of inventions acquired by the number-of-inventions acquisition means; and calculate the total number of effective patents by subtracting the number of extinguished inventions from said acquired number of inventions; and generate display data for associating the total number of effective patents and the patent stock index for display.

Therefore, it is possible to display, in an easy-to-read manner, the correlation of the value of total number of effective patents and the value of patent stock index. For instance, when the value of total number of effective patents is large and the patent term expiration sufficiently remains, it is possible to judge that the exclusive technical strength is great, and the enterprise has strong power based on patent rights.

Contrarily, if the value of total number of effective patents is small and the value of patent stock index is also small, it is possible to judge that the exclusive technical strength is small, and the enterprise has weak power based on patent rights.

[0200]

Moreover, according to the present invention, the display data generation means is able to generate display data for associating the sales volume acquired by the sales volume acquisition means and patent stock index for display.

Therefore, it is possible to indicate that there is a

close correlation between the sales volume and patent stock index. Further, it is also possible to indicate the differences in trends among industries.

Thereby, since the differences per industry and per enterprise can be clearly read, it is possible to analyze the research and development strategy and intellectual property strategy of an enterprise, and it is possible to judge the enterprise evaluation more accurately.

[0201]

According to the enterprise evaluation device and enterprise evaluation program of the present invention, it is possible to quantitatively and qualitatively incorporate the value of intangible assets and evaluate the validity of the enterprise value.

[0202]

Further, according to the enterprise evaluation device and enterprise evaluation program of the present invention, it is possible to know the trend of the enterprise per technical field or predict the potential of the enterprise when making an investment in a specified enterprise, when jointly developing a product with a specified enterprise, or when wishing to be employed in a specified enterprise.
